## Municipal Water Tank Repaired and Protected with ENESEAL CR

### Problem:

This customer's municipal water tank was corroding and in overall disrepair. Due to UV exposure, the existing coating was also delaminating, causing further deterioration.

### Solution:

**ENESEAL CR**'s surface tolerance and corrosion resistance (CR) made it the easy choice for this job, especially since it can be easily brushed, rolled, or sprayed on, as in this case. Surface preparation was also simple with no grit-blasting required. ENECON's expert application team simply removed all loose material with a high pressure wash and was quickly and easily able to begin the spray-on application. With the primer already incorporated within the product, this **ENESEAL CR** application did not require a costly or time-exhaustive priming coat before application.

### Result:

Thanks to the rust inhibitor and elastomeric properties also incorporated into **ENESEAL CR**, this solution will expand and contract with the structure, so it won't crack over time. Finally, unrivaled UV resistance also means that the finish won't feel "chalky" years later. This cost-effective, turnkey application was completed in less than two weeks and will provide unsurpassed protection for years to come.
